

We have a Centos server, and in var/www/html/ path we created a folder called “develop”. In this folder we placed clear template.

After that, we have already executed:

- Npm install
- Npm run dev

(sometimes npm run dev fails, and was necessary to execute yarn install)

But some errors appear in browser console, something like “chunk 3 not found”

In Google we found that in Webpack, is necessary to put this:

```
output:{
  //publicPath: './' //set this for production purpose
  pathinfo: true,
  filename: '[name].js',
  chunkFilename: '[chunkhash].chunky.js',
  crossOriginLoading: 'anonymous'
}
```

But when we executed again “npm run dev”, the error is:

```
⚠ El script de "http://192.168.10.253:8080/develop/main.js" fue cargado a pesar de que su tipo MIME ("text/html") no es un tipo MIME válido de JavaScript. \[Saber más\]
⚠ Ha fallado la carga del módulo con origen "http://192.168.10.253:8080/develop/main.js".
```

Basically, the template failed to load main js

Is necessary to execute any additional command?? O we have to config an extra file??
